

V

- B. Deploy an external HTTP(S) load balancer, configure Google Cloud Armor, and move the application onto Compute Engine virtual machines.
- C. Containerize the application and move it into Google Kubernetes Engine (GKE) Create a GKE service to expose the pods within the cluster, and set up a GKE 元 network policy.
- D. Containerize the application and move it into Google Kubernetes Engine (GKE). Create an internal load balancer to expose the pods outside the cluster, and configure Identity-Aware Proxy (IAP) for access.

## Correct answer

B. Deploy an external HTTP(S) load balancer, configure Google Cloud Armor, and move the application onto Compute Engine virtual machines.

## Feedback

A is not correct because firewall rules do not block malicious traffic into a VPC but rather block it at the VM level.

B is correct because the external HTTP(s) load balancer will improve access latency and Cloud Armor can be configured to block the Distributed Denial-of-Service (DDoS) attack.

D is not correct because a GKE internal load balancer will not load balance external traffi and anonymous users need access to the website so IAP is not a fit.

For this question, refer to the EHR Healthcare case study. https://services.google.com/fh/files/blogs/master\_case\_study\_ehr\_healthcare.pdf

X

EHR wants to connect one of their data centers to Google Cloud. The data center is in a remote location over 100 kilometers from a Google-owned po center is in a remote location over 100 kilometers from a Google-owned poof presence. They can't afford new hardware, but their existing firewall can accommodate future throughput growth. They also shared these data points accommodate future throughput growth. They also shared these data points accommodate future throughput growth. They also shared these data points accommodate future throughput growth. They also shared these data points accommodate future throughput growth. They also shared these data points accommodate future throughput growth. They also shared these data points accommodate future throughput growth. They also shared these data points accommodate future throughput growth. They also shared these data points accommodate future throughput growth. They also shared these data points accommodate future throughput growth. They also shared these data points accommodate future throughput growth. They also shared these data points accommodate future throughput growth. They also shared the configuration of the configuration of the configuration future.

Servers in their on-premises data center need to talk to Google. The configured with private RFC 1918 look and private RFC 1918 look and private RFC 1918 communications by itself.

Cis correct because it does not give private IP addressing across the connection.

B is not correct because an additional Internet connection will not provide RFC1918 communications by itself.

Cis correct because it allows the customer to lower latency by connecting directly to a partner network that is directly connected to Google. This option will also allow the customer to use the lower bandwidth interfaces that they have on their current firewall.

D is not correct because Dedicated Interconnect would require the customer to buy new partner developed the control of their firewall. of presence. They can't afford new hardware, but their existing firewall can

### Correct answer

D is not correct because Dedicated Interconnect would require the customer to buy new hardware to get a 10 gig interface for their firewall.

- X The EHR sales employees are a remote-based workforce that travels to different locations to do their jobs. Regardless of their location, the sales employees need to access web-based sales tools located in the EHR data center. EHR is retiring their current Virtual Private Network (VPN) infrastructure, and you need to move the web-based sales tools to a BeyondCorp access model. Each sales employee has a Google Workspace account and uses that account for single sign-on (SSO). What should you details
- A. Create an Identity-Aware Proxy (IAP) connector that points to the sales tool application.
- AND OFFICE B. Create a Google group for the sales tool application, and upgrade that group t security group.
- C. Deploy an external HTTP(S) load balancer and create a custom Cloud Armor policy for the sales tool application.
- D. For every sales employee who needs access to the sales tool application, give their Google Workspace user account the predefined AppEngine Viewer role.

# Correct answer

A. Create an Identity-Aware Proxy (IAP) connector that points to the sales tool application.

# **Feedback**

A is correct because Identity-Aware Proxy (IAP) connector allows you to manage access to HTTP-based apps outside of Google Cloud.

B is not correct because Google groups by themselves do not grant access to an application nor do they move an application to a beyond corp model.

C is not correct because Cloud Armor does not authenticate or authorize application access.

D is not correct because the application is installed in the datacenter, not in the AppEngir environment.

this question, refer to the Mountkirk	Games case study.

×	Mountkirk Games wants you to make sure their new gaming platform is be operated according to Google best practices. You want to verify that Google recommended security best practices are being met while also providing operations teams with the metrics they need. What should you do? (Choo two)	tles s
	A. Ensure that you aren't running privileged containers.	
	B. Ensure that you are using obfuscated Tags on workloads.	
	C. Ensure that you are using the native logging mechanisms.	
	D. Ensure that workloads are not using securityContext to run as a group.	
<b>✓</b>	E. Ensure that each cluster is running GKE metering so each team can be charged for their usage.	
Corr	rect answer	Ž
	A. Ensure that you aren't running privileged containers.	
	C. Ensure that you are using the native logging mechanisms.	
F	eedback	
Α	is correct because this is High Priority according to Google best practices.	
	is not correct because tags should be readable and useful to the operations teams wheney are working on the clusters.	e
С	is correct because this is High Priority according to Google best practices.	
D	is not correct because this may be required for some workloads.	
	is not correct because although from a business process this may be useful it won't inpact the operations or security of the cluster.	
	https://cloud.google.com/	
	nis question, refer to the Mountkirk Games case study. ://services.google.com/fh/files/blogs/master_case_study_mountkirk_games.pdf	

✓ Your new game running on Google Cloud is in public beta, and you want to design meaningful service level objectives (SLOs) before the game becomgenerally available. What should you do?
A. Define one SLO as 99.9% game server availability. Define the other SLO as less than 100-ms latency.
B. Define one SLO as service availability that is the same as Google Cloud's availability. Define the other SLO as 100-ms latency.
availability. Define the other SLO as 100-ms latency.  C. Define one SLO as 99% HTTP requests return the 2xx status code. Define the other SLO as 99% requests return within 100 ms.
D. Define one SLO as total uptime of the game server within a week. Define the other SLO as the mean response time of all HTTP requests that are less than 100 ms.
Feedback
A is incorrect because it doesn't clearly define how to measure both the availability and latency.
B is incorrect because Google Cloud availability has an impact on customer availability but it is only one factor. Also, for different Google Cloud products, the availability could be different.
C is correct because it clearly defines the service level indicators and how to measure them.
D is incorrect because there is no objective for the server uptime.
https://landing.google.co
For this question, refer to the Helicopter Racing League (HRL) case study. <a href="https://services.google.com/fh/files/blogs/master_case_study_helicopter_racing_league">https://services.google.com/fh/files/blogs/master_case_study_helicopter_racing_league</a> df

✓ HRL wants you to help them bring existing recorded video content to new fin emerging regions. Considering the HRL business and technical requirements, what should you do?	
A. Serve the video content directly from a multi-region Cloud Storage bucket.	7
<ul> <li>A. Serve the video content directly from a multi-region Cloud Storage bucket.</li> <li>B. Use Cloud CDN to cache the video content from HRL's existing public cloud provider.</li> <li>C. Use Apigee Edge to cache the video content from HRL's existing public cloud</li> </ul>	
C. Use Apigee Edge to cache the video content from HRL's existing public cloud provider.	
D. Replicate the video content in Google Kubernetes Engine clusters in regions close to the fans.	<u> </u>
Feedback	
A is not correct because a multi-region bucket does not serve all global areas with similal latency.	
B is correct because Cloud CDN can be used to cache data hosted on other cloud providers and supports large objects such as video.	
C is not correct because Apigee Edge is not designed to cache data larger than 512 KB.  D is not correct because replicating the video content introduces unnecessary complexity

×	You are the data compliance officer for TerramEarth and must protect customers' personally identifiable information (PII), like credit card information. TerramEarth wants to personalize product recommendations its large industrial customers. You need to respect data privacy and deliver solution. What should you do?	
C	A. Use AutoML to provide data to the recommendation service.	
•	B. Process PII data on-premises to keep the private information more secure.	
C	C. Use the Cloud Data Loss Prevention (DLP) API to provide data to the recommendation service.	
C	D. Manually build, train, and test machine learning models to provide product recommendations anonymously.	
Cor	rect answer	
•	C. Use the Cloud Data Loss Prevention (DLP) API to provide data to the recommendation service.	
F	eedback	750×
Д	is not correct because AutoML does not inherently provide data de-identification.	*
	B is not correct because TerramEarth's requirements are to go into the cloud, not stay on- premises.	
C	is correct because Cloud DLP was specifically designed for this use case.	2
	is not correct because developing machine learning models is an excessive way to dedentify data.	
	https://cloud.google.com/	
		<del></del>

		_
×	You are designing a future-proof hybrid environment that will require netw connectivity between Google Cloud and your on-premises environment. You want to ensure that the Google Cloud environment you are designing is compatible with your on-premises networking environment. What should you?	
0	A. Use the default VPC in your Google Cloud project. Use a Cloud VPN connection between your on-premises environment and Google Cloud.	
0	B. Create a custom VPC in Google Cloud in auto mode. Use a Cloud VPN connection between your on-premises environment and Google Cloud.	×
•	C. Create a network plan for your VPC in Google Cloud that uses CIDR ranges that overlap with your on-premises environment. Use a Cloud Interconnect connection between your on-premises environment and Google Cloud.	
0	D. Create a network plan for your VPC in Google Cloud that uses non-overlappin CIDR ranges with your on-premises environment. Use a Cloud Interconnect connection between your on-premises environment and Google Cloud.	
Cor	rect answer	
•	D. Create a network plan for your VPC in Google Cloud that uses non-overlapping CIDR ranges with your on-premises environment. Use a Cloud Interconnect connection between your on-premises environment and Google Cloud.	
F	eedback	<b>8</b>
	is not correct because the default VPC is a VPC with Auto Mode IP ranges, which has he same problem as answer C.	
	Is not correct because with Auto Mode IP Ranges there is no guarantee that the IP anges will not overlap with your on premises environment, either now or in the future.	
	is not correct because to ensure correct routing, ranges cannot overlap between nvironments.	<b>8</b>
	is correct because this ensures your on premises network is compatible with your Google Cloud VPC.	
	https://cloud.google.com/	

- Your company wants to track whether someone is present in a meeting rowreserved for a scheduled meeting. There are 1000 meeting rooms across offices on 3 continents. Each room is equipped with a motion sensor that reports its status every second. You want to support the data ingestion newsof this sensor network. The receiving infrastructure needs to account for the possibility that the devices may have inconsistent connectivity. Which solution should you design?
- A. Have each device create a persistent connection to a Compute Engine instand and write messages to a custom application.
- B. Have devices poll for connectivity to Cloud SQL and insert the latest message on a regular interval to a device specific table.
- C. Have devices poll for connectivity to Pub/Sub and publish the latest messages on a regular interval to a shared topic for all devices.
- D. Have devices create a persistent connection to an App Engine application fronted by Cloud Endpoints, which ingest messages and write them to Datastore

### **Feedback**

A is not correct because having a persistent connection does not handle the case where the device is disconnected.

B is not correct because Cloud SQL is a regional, relational database and not the best fit for sensor data. Additionally, the frequency of the writes has the potential to exceed the supported number of concurrent connections.

C is correct because Pub/Sub can handle the frequency of this data, and consumers of the data can pull from the shared topic for further processing.

D is not correct because having a persistent connection does not handle the case where the device is disconnected.

Cloud Virtual Private Cloud (VI independently of the others. N	web application deployed in the same Google PC). Each tier (web, API, and database) scales etwork traffic should flow through the web to database tier. Traffic should not flow between How should you configure the network with bnetwork.
A. Add each tier to a different su	bnetwork.
B. Set up software-based firewal	ls on individual VMs.
C. Add tags to each tier and set u	
D. Add tags to each tier and set u	up routes to allow the desired traffic flow.  up firewall rules to allow the desired traffic flow.
Feedback  A is not correct because the subnetwork alone will not allow and restrict traffic as require without firewall rules.  B is not correct because this adds complexity to the architecture and the instance configuration.  C is not correct because routes still require firewall rules to allow traffic as requests. Additionally, the tags are used for defining the instances the route applies to, and not for identifying the next hop. The next hop is either an IP range or instance name, but in the proposed solution the tiers are only identified by tags.  D is correct because as instances scale, they will all have the same tag to identify the tier. These tags can then be leveraged in firewall rules to allow and restrict traffic as required, because tags can be used for both the target and source.	
https://cloud.google.com/	
https://cloud.google.com/

		×
<b>✓</b>	You are designing a large distributed application with 30 microservices. Early of your distributed microservices needs to connect to a database backend You want to store the credentials securely. Where should you store the credentials?  A. In the source code	
C	A. In the source code	漢
C	B. In an environment variable	<u>~</u>
•	C. In a secret management system	
C	D. In a config file that has restricted access through ACLs	で心臓ない
F	Feedback	2
t	A is not correct because storing credentials in source code and source control is liscoverable, in plain text, by anyone with access to the source code. This also introduces the requirement to update code and do a deployment each time the credentials are otated.	$\approx$
	B is not correct because consistently populating environment variables would require the credentials to be available, in plain text, when the session is started.	ð
a	C is correct because a secret management system such as Secret Manager is a secure and convenient storage system for API keys, passwords, certificates, and other sensitive data. Secret Manager provides a central place and single source of truth to manage, access, and audit secrets across Google Cloud.	×
n	D is not correct because instead of managing access to the config file and updating manually as keys are rotated, it would be better to leverage a key management system. Additionally, there is increased risk if the config file contains the credentials in plain text.
